

Investigation Summary Report

Private Residence
Jonesboro, LA

HISTORY

PRIVATE RESIDENCE
JONESBORO, LA.

DATE OF INVESTIGATION: April 16, 2011

PARTICIPANTS: Bess Maxwell, Traci Myers, Tricia Grayson, Keith Myers, John Combs

NOTE: The client in this investigation has requested confidentiality. Some information may have been obscured to honor this request. This in no way affects the data presented, or any conclusions herein.

BACKGROUND

The client has lived in this home for many years. The concerns began in approximately August of 2010, when one relative moved out of the home, and some remodeling and painting were performed. The incidents have included electronic items being turned on, and malfunctions of electronic items when no natural cause could be found. Shadow figures have been seen in the living room, and a monochromatic image of a male figure has been observed in the driveway. Some objects have been moved around, from places they are normally kept, to places where they would not be normally repositioned to. Light anomalies have accompanied at least some of the reported events. Client also reports nightmare-type dreams or images after the activity began. Pets which have normally have been allowed in the home were observed to be wary and uncomfortable inside the home, after the activity began.

EQUIPMENT: Digital Cameras, IR Video Cameras and DVR Recorder, Digital Audio Recorders, Various EMF Meters, including Tri-Fields, Motion Detectors, Laser Grid System for Motion Detection, Geo-Phone for Vibration to Visual Translations, Ion Counters, Digital Thermometers, Infrasound Detection Equipment, and PEAR REG-1 Units for the detection of human consciousness with software on Hewlett-Packard computers.

INVESTIGATION

At the time of investigation, and in the places investigated, no abnormal positive ion counts were found, and no infrasound standing waves were noted. No abnormal EMF fields were detected in areas where individuals might receive prolonged exposure. No anomalies were detected in still photography, or on video. No anomalous hot or cold spots were detected. No unexplainable motion noted by motion detectors. Geophone anomaly is listed under personal experiences of observers.

ELECTRONIC VOICE PHENOMENON

A total of seven possible audio anomalies were examined by La. Spirits members, including an EVP full-time analyst. It is noted that one audio recording was of a bump/thump on a wall, heard by three individuals and recorded. However, it was not in a response to communicate, and could have been a natural noise, and is not considered evidential. EVP one, in a back bedroom, investigators Bess Maxwell, Traci Myers and Keith Myers recorded an EVP of what is thought to be an EVP of an individual singing, and is indicative of songs known as spirituals. The exact words were indeterminate, but the singing voice is indicative as above. EVP two, in the same room, with the same 3 investigators, consists of a young, male voice, stringing out the word "let's" in the phrase, "Let's go". EVP three was recorded in the "doll room", with the three above investigators present. Bess Maxwell comments "anomalies and maybe it was moving those dolls". A male voice speaks the word "dolls" on top of Bess Maxwell's word "dolls". The voice was not Keith Myers. EVP four was recorded by the three investigators recording the above three clips. The clip four was caught in the doll room. The investigators were discussing a geophone that had fired for no apparent, natural cause, indicating that "You don't want to look right at those lights". Keith Myers replies, "They're bright". A female voice, neither Bess Maxwell, or Traci Myers, indicates "I do in the summertime". The other sound clips were not considered strong enough to be evidentiary in nature. See appendix "C" for more information on EVP standards and indications.

PERSONAL EXPERIENCES

Personal experiences are those that involve phenomena personally observed, heard, felt, etc. by researchers during the investigation that may not be readily explained by normal means, by experienced researchers.

John Combs: One of the events attributable to the paranormal is the sudden draining of batteries. Because of this, I normally replace batteries in the items I used the most, on each research project. Before leaving home, I did replace the batteries in my flashlight. The package that the batteries came from was reasonably new, and the prior batteries that I had use did function normally, so I have reason to believe that the ones I placed into the flashlight that afternoon were not factory defective. On location, about ten minutes after beginning to use the flashlight, though the ten minutes were not of constant use, the batteries were completely drained, and hot to the touch. No natural explanation could be found.

Light Anomaly: In the room in which it was reported that a doll had been moved, investigator Tricia Grayson observed a large ball of light above the cabinet on which the doll rested, moving from right to left. This was approximately 9:45 to approximately 9:50 P.M. This area is on the

back side of the home, and no outside light could have caused the phenomenon, and we did attempt to recreate the event also by driving in front of the home, both directions, and at varying speeds, but this would not duplicate the event. Later, a geophone placed on top of this cabinet did fire repeatedly, when no local vibrations were noted that could have caused the firing. These events were witnessed by investigators Bess Maxwell, Tricia Grayson, and Keith Myers. In the master bedroom, under observation by Bess Maxwell, Tricia Grayson, and Keith Myers, a flashlight flickered, then came on with no individual near it, after a request to turn on the light was made. This occurred at approximately 11:07 P.M. At 12:13 A.M, in the living room, a flashlight was turned on again with no one near this light, after a request was made to do so.

SECTION TWO

CONSCIOUSNESS DETECTION

This testing is passive in nature and designed to detect through quantum tunneling, the probability that a human type consciousness may be present affecting the REG- 1 units, when all incarnate consciousness has been removed from the area of testing. The minimum reporting standard for this type of testing is $p < .05$, with the .05 being the probability the event could be the result due to chance alone in the probability distribution. A total of 57 tests were run, in all areas of the residence. At the minimum reporting standard of .05, we could expect to receive 2.85 false positive tests, due to chance alone. ($57 \times 5\% = 2.85$) This would be rounded off, of course, to three false positives expected. We received a total of twenty positive tests, as opposed to three expected by chance. The actual mean score of the twenty tests, as many did exceed below .05, was $p < .033543$. The corrected expectation, from actual data, would therefore be 1.91 false positives, rounded up to two. Therefore, we received eighteen more positive tests than chance alone could account for at normal probability distribution. The tests and scores were as follows:

COMPUTER 1

Master bath, test 1 $z = 1.652$ $p < .049267$
Bedroom, right rear test 3 $z = 2.086$ $p < .018489$
Kitchen, test 5 $z = 2.227$ $p < .012974$
Kitchen, test 6 $z = 3.099$ $p < .000971$
Kitchen, test 7 $z = 1.670$

COMPUTER 2

Master bedroom, test 2 $z = 1.715$ $p < .043173$
Master bedroom, test 3 $z = 2.074$ $p < .01904$
Master bedroom, test 4 $z = 1.845$ $p < .032519$
Master bedroom, test 5 $z = 2.073$ $p < .019086$
Master bedroom, test 6 $z = 1.668$ $p < .047658$
Master bedroom, test 7 $z = 1.660$ $p < .048457$
Hall, test 1 $z = 1.645$ $p < .049985$
Living room, test 6 $z = 1.783$ $p < .037293$

COMPUTER 3

Bedroom, left rear, test 4 $z = 1.658$ $p < .048659$
Main bathroom, test 3 $z = 1.647$ $p < .049779$
Kitchen, test 2 $z = 2.758$ $p < .002908$
